3.28 :WAVeform Commands

:WAVeform commands are used to read waveform data and relevant settings. The *:WAVeform:MODE* command is used to set the reading mode of waveform data. In different modes, the definitions for the parameters are different, as shown in *Figure 3.12* and *Figure 3.13* .

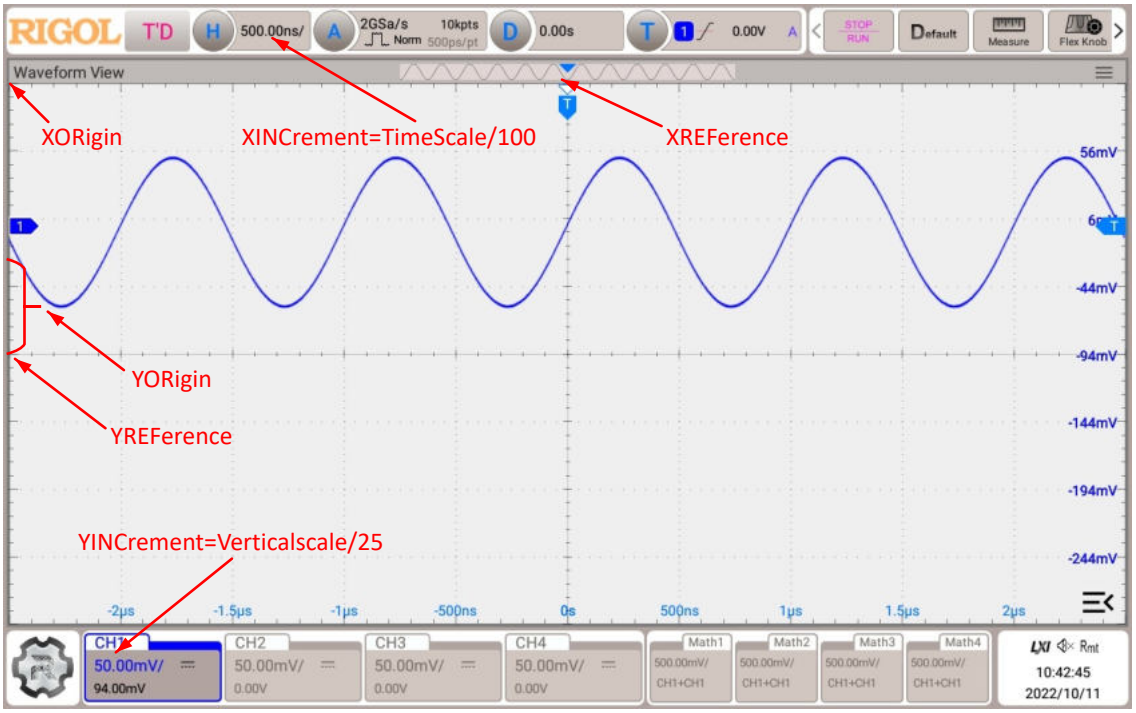

Figure 3.12 Parameter Definitions in NORMAL Mode

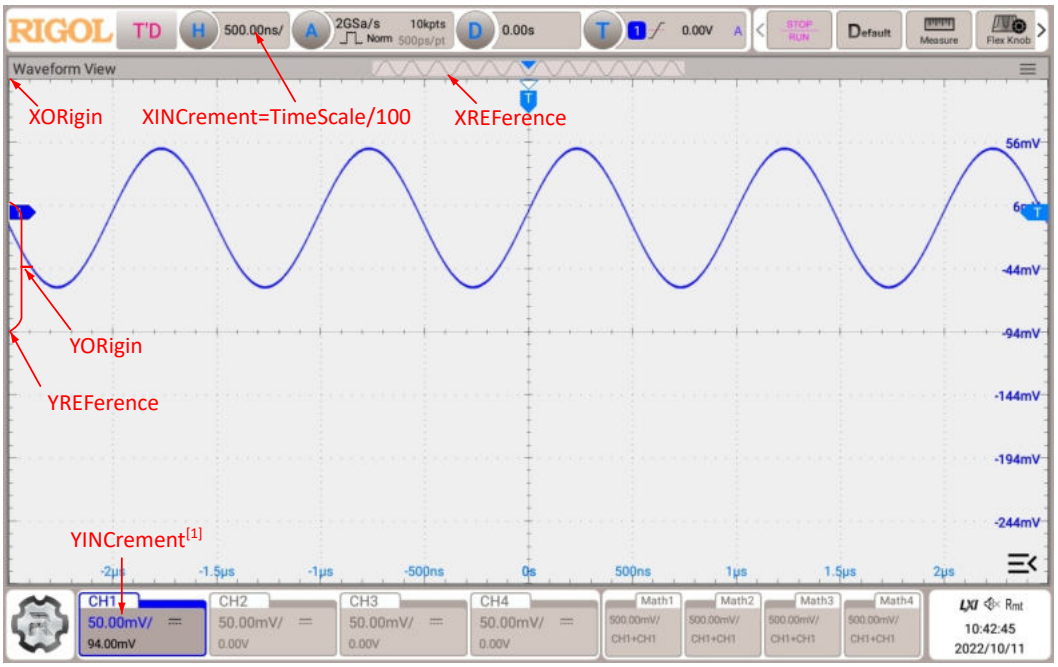

Figure 3.13 Parameter Definitions in RAW Mode

NOTE

[1]: In RAW mode, YINCrement and Verticalscale of the memory waveforms are related to the currently selected Verticalscale.

Waveform Data Reading

- **WORD/BYTE format:** The read data format is TMC header + waveform data points + end identifier. The TMC header is in #NXXXXXX format; wherein, # is the TMC header identifier; N following # represents the length of the waveform data; the length of the waveform data points is expressed in ASCII strings, and the terminator represents the ending of communication. For example, the data read for one time is #9000001000XXXX. "9" indicates the length of data, and "000001000" indicates the length of the binary data stream, that is, 1000 bytes.
- **ASCii format:** The read data format is waveform data points + end identifier. The waveform data point query returns the actual voltage value of each waveform point in scientific notation. The voltage values are separated by commas.
- When the waveform data in the internal memory are read in batches, the waveform data returned each time might be the data in one area of the internal

memory. In "WORD" or "BYTE" return format, each returned data in blocks contain the TMC data block header. Waveform data in two adjacent data blocks are consecutive.

- The figure below shows the waveform data that have been read (in BYTE format). First, select "View as hexadecimal only" from the drop-down list at the right side. Then, the waveform data that have been read are displayed in hexadecimal format. The first 11 bytes denote the "TMC data block header", and beginning from the 12th byte (8E) are the waveform data. You can convert the waveform data read to the voltage value of each point of the waveform by using the formula "(0x8E - YORigin - YREFerence) x YINCrement". For the definitions of the parameters in this formula, refer to *Related Commands*.
